

EMI's Remanufacturing Program

We remanufacture to 'As New' condition and back our work with a 'New Machine Guarantee'

EMI has a comprehensive remanufacturing program.

Our remanufacturing program procedures, where applicable, follow:

- The machine is reduced to a component state with main, reusable parts being high pressure washed, sand blasted, ground free of foreign metals, primed and painted in preparation of assembly.
- All wear parts are replaced with new. This is all-inclusive.
- All cylinders will be fully rebuilt including cylinder barrels and rods when required.
- All solenoid valves will be rebuilt or replaced with new as required.
- All machine mounted electrical, including conduit, sealite and wire will be new.
- All major electrical components such as pressure switches and limit switches will be new. The limit switches will be of the plug-in type with Allen-Bradley as our standard.
- All piping, rigid or hose, will be new.
- Pressure regulators, filters, lubricators and gauges will be new and will be conveniently located for service.
- Control panels can be cleaned and reused or new PLC (Allen-Bradley is our standard) panels can be provided. Operator HMI panels are available.
- All machines are finally inspected and thoroughly tested.
- Any improvements in the original manufacturer's machine not existing on the specific machine being rebuilt will be offered as an option by EMI.
- The remanufactured machine carries an EMI guarantee of 180 days and OEM purchased component warranties as apply.
